# The UMD College of Information Studies (the iSchool)

# SOCIOTECHNICAL SYSTEMS PERSPECTIVE: PREMISES

- The mutual constitution of people and technologies
- Contextual embeddedness
- Importance of collective action
- Therefore:
  - Examine not just the technological system not just the social system or both side-by-side
  - Investigate when the two systems interact and the phenomena that emerge

# MUTUAL CONSTITUTION

- Both humans and technologies have some ability to act (agency)
  - Directionality can go in both ways
  - Actions are not deterministic and are dependent on context
- Focus is on co-evolution of the technical and social
- Therefore attend to:
  - Material triggers
  - Actions of social groups
  - Pressures from contextual influences
  - Complex processes of development, adoption, adaptation, and use of new technologies in people's social worlds

## CONTEXT: TECHNOLOGIES ARE SOCIALLY SITUATED

- Technologies embedded in a social context that adapts to them and reshapes them through design, development, deployment, and use
- Decontextualizing technologies limits our understanding
- Complex social processes embed technological innovation within organizational and social contexts
- Temporal dimension matters

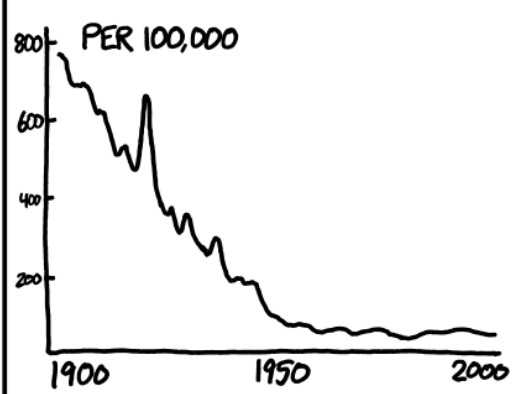

## COLLECTIVE ACTION BY MULTIPLE PARTIES

- Different goals create conflict
- Shared goals energize the design, development, deployment, and use of new technologies

WELCOME TO THE *DEGREE-OFF*,  
WHERE WE DETERMINE  
WHICH FIELD IS THE BEST!  
PHYSICS, WANNA GO FIRST?

... AND AS HE SAID,  
"ALL SCIENCE IS  
EITHER PHYSICS OR  
STAMP COLLECTING."

THE HEROES OF MY FIELD  
HAVE *SLAIN* ONE OF  
THE FOUR HORSEMEN  
OF THE APOCALYPSE.

WHILE THE HEROES OF  
YOUR FIELD GATHERED  
IN THE DESERT TO  
CREATE A NEW ONE.

... JEEZ, WHAT THE HELL?  
I THOUGHT THIS WAS SUPPOSED  
TO BE FUN AND LIGHTEARTED!

## COLLECTIVE ACTION BY MULTIPLE PARTIES

- Different goals create conflict
- Shared goals energize the design, development, deployment, and use of new technologies

# SOCIOTECHNICAL SYSTEMS RESEARCH

- Foregrounds the complexity and uncertainty of technologically-involved change
- Adopts process logic to investigate the reciprocity and co-evolution of the contextual interactions and outcomes
- Focuses on heterogeneous networks of institutions, people, and technological artifacts that play roles in the design, development, deployment, uptake, and uses of any particular technology

# DESIGNING EFFECTIVE SOCIO-TECHNICAL SYSTEMS

- Non-deterministic, but there are path dependencies
- A sociotechnical perspective allows mindful shaping of the co-evolution of:
  - Technologies
  - Policies
  - Organizations
  - Institutions
- Increased probability of reaching desired goals

STATE OF THE ART

## A Blockchain Research Framework

What We (don't) Know, Where We Go from Here, and How We Will Get There

Marten Risius · Kai Spohrer

A grid of research questions categorized by

- **Activities by developers and users:** *design and features, measurement and value, management and organization*

and

- **Levels of analysis upon which these activities yield influence:** *users and society, intermediaries, platforms, firms and industry*

Level of analysis	Activities

## Abstract

Over recent years, the innovative decentralized payment system Bitcoin has received much attention in practice and academia. Despite a growth of transaction volume and an increasing attention in the area of e-commerce, there is little academic research examining the factors influencing adoption. To fill this research gap, this paper documents an exploratory study of the key determinants and inhibitors of Bitcoin use. Drawing upon the Technology Acceptance Model and a literature review, we integrate various benefits and risks of Bitcoin use to form the multidimensional constructs Perceived Benefit and Perceived Risk. We propose and empirically test a theoretical model that explains the use of Bitcoin as an online payment system for legitimate purchases and money transfers. Furthermore, we recognize several conceptual and methodological development potentialities for technology acceptance theories in the context of decentralized and sharing economy systems.

**Keywords:** Bitcoin, blockchain, decentralization, information technology adoption, perceived benefit, perceived risk, payment system, electronic commerce

Measure	Items		
Gender	Male (n=81; 94.2%)	Female (n=2; 2.3%)	Not specified (n=3; 3.5%)

Platforms	<p>How do blockchain platforms differ regarding features and designs?</p> <p>How can different blockchain systems complement each other to overcome individual constraints?</p>	<p>How can blockchain systems er dissemination among users and operating systems?</p> <p>What are the complementary be blockchain systems to established information systems?</p>	<p>How can they be managed or prevented?</p>
Firms and industries	<p>How can firms utilize blockchain features for their own business processes?</p> <p>What blockchain features are relevant for different company divisions or industry branches?</p> <p>What type of blockchain is best-suited for the respective purposes?</p>	<p>How does blockchain provide added value for companies to conduct transactions within the company or with customers, other companies,</p>	<p>How do organizations act under different blockchain based regimens of data privacy/confidentiality?</p> <p>Can new forms of organization be managed effectively on a blockchain? If so, how and why?</p>

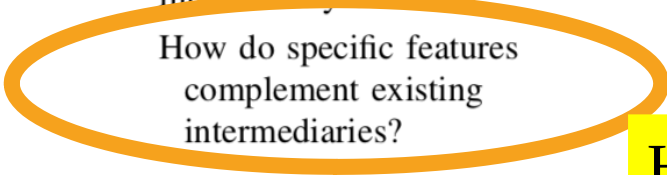

What type of blockchain is best-suited for the respective purposes?

	Permissionless Blockchain	Public Permissioned Blockchain	Private Permissioned Blockchain	Central Database
<b>Throughput</b>	Low	High	High	Very High
<b>Latency</b>	Slow	Medium	Medium	Fast
<b>Number of readers</b>	High	High	High	High
<b>Number of writers</b>	High	Low	Low	High
<b>Number of untrusted writers</b>	High	Low	Low	None
<b>Consensus mechanism</b>	Mainly PoW, some PoS	Supports multiple approaches but mostly uses BFT protocols (e.g. PBFT [6])	Supports multiple approaches but mostly uses BFT protocols (e.g. PBFT [6])	None
<b>Centrally managed</b>	No	Yes	Yes	Yes
<b>Censorship</b>	Censorship Resistant (Anonymous consensus)	Not Censorship Resistant	Not Censorship Resistant	N/A
<b>Validators</b>	All are Dynamic Membership Multi-party Signature(DMMS) validators (not always known writers)	Mostly known DMMS validators	Legally accountable validators	Only trusted validators
<b>Assets Suitability</b>	Suitable for on-chain assets (virtual bearer asset) e.g. , bitcoin/ether	Bearer asset becomes registered asset	Suitable for off-chain assets (securities, fiat, titles)	Suitable for online/offline assets
<b>Settlement Finality (Irreversible )</b>	Yes	No	No	No

We differentiate between permissionless, permissioned blockchains and a centralized database. Note that a permissioned blockchain can be public, for example if public verifiability of the content is desired.

**How do specific features complement existing intermediaries?**

What are the effects of hard forks? How can they be managed or prevented?

How do organizations act under different blockchain based regimens of data privacy/confidentiality?

How does decentralized control work in industry-wide blockchain systems?

Can new forms of organization be managed effectively on a blockchain? If so, how and why?
